

If I had the ability to use CRISPR tech to change my body, I would want to make changes that benefit my overall health and well-being. The first thought that comes to mind is having an increased resistance to diseases and improving different functions like a better functioning kidney over a longer time. Whether or not an individual should be able to change the human body genetically is a large question. While I do personally believe in personal bodily autonomy, you must also balance the ethical questions to ensure there is no misuse of genetic change. So, genetic changes overall should be allowed with many regulations that ensure personal safety.
