

A use case of robotics where I would be proud my code was involved could be several public service settings. For example, a robot assisting individuals in boarding the correct train at a train station using my code would be a proud moment as the robot is benefiting society and the individuals around it. A use case of robotics where I would be concerned my code was involved would be numerous amount of scenarios in defense, like if a robotic drone dropping a payload was running my code, I would be concerned as this is a use case that could harm society and inflict pain on other individuals. If I wrote this code for a large company, I would assume I have little control over how my code is used as a large corporation will simply use it where it sees fit. I believe the perfect amount of control would be 50/50, where your code is not doing something you believe to be immoral or wrong.
