

## **Final Project Proposal**

Aiden Morrison

### **SECTION J**

**1. Description of dataset:**

- a. I am using the Car Information dataset. It is a basic dataset including name, miles per gallon, number of cylinders, displacement, horsepower, weight, acceleration, model year, and country of origin for a variety of vehicles.

**2. Data question to be answered:**

- a. I want the data to connect the correlation of number of cylinders to the fuel economy of a vehicle. The data can do this by performing a correlation analysis to determine this relationship. I can then create a few different visualizations to paint a clear picture of what this correlation is and communicate it in an effective manner.
